Field of the Invention The invention relates to an image forming apparatus using an electrophotographic recording method, and specifically to an image forming apparatus using a direct electrophotographic recording method that is suitable for a high-speed printer that prints at a high speed. 2. Related Background Art In an image forming apparatus in an electrophotographic recording method, it is necessary to form a toner image for each color. A method has been generally adopted in which toner images of respective colors are overlapped and fixed on a recording medium such as paper. When images are formed by the aforementioned toner image forming method, the images are sequentially formed on an image bearing member such as a photosensitive member or a dielectric member, and this image bearing member is then superimposed on the recording medium. The toner images are transferred and fixed to the recording medium by a transfer method such as an electric field transfer method, a contact transfer method, or a corona transfer method. FIG. 13 is a schematic view showing a conventional image forming apparatus, and FIG. 14 is a perspective view showing a developing roll in the conventional image forming apparatus. In FIG. 13, a reference numeral 100 denotes a photosensitive member, a reference numeral 200 denotes a developing roll, a reference numeral 300 denotes a developing agent, and a reference numeral 400 denotes a toner. A surface of the photosensitive member 100 is uniformly charged by a charging device not shown, and the photosensitive member 100 is exposed to a light image based on image data by an exposure device 101, thereby forming an electrostatic latent image on a surface of the photosensitive member 100. The electrostatic latent image formed on the surface of the photosensitive member 100 is developed into a toner image by a developing device 102 by using the developing roll 200 and a toner 300 as developer. This toner image is transferred to a recording medium such as paper by a transfer device 103, and the toner image is fixed to the recording medium by a fixing device 104. In the image forming apparatus shown in FIG. 13, an amount of the developer in a development zone is

What's New in the?

Look for the new Quick Access toolbar icon, as shown in the image below. When you add the tab to your Quick Access toolbar, you'll see a new icon with the name "Markup Import." After you open a print, PDF, image, or other reference, the Markup Import tab appears automatically on the New Drawing Tab. The Markup Import tab allows you to import feedback into your current drawings. When you import feedback, you can change text, change the color of text, add annotation, or add borders, all without first creating a markup block and adding a text frame. It also lets you import elements from other files, too, so you can quickly incorporate elements from other drawings. The Markup Import feature is based on the Markup Assist feature of AutoCAD® 2016. Markup Assist was a great tool for quickly reviewing information from paper and PDF files. But it required you to save the file as a draft, and then you had to review the file to add feedback. Markup Import has made it easy to incorporate feedback. You no longer have to save a draft. You can review the changes with ease, and then make the changes right away. Markup Import also makes it easier to review print references. You can get the feedback right away, rather than having to open the print first and then save it as a draft. We're excited about the new feature and how it can improve your workflow. If you're interested, watch the video above. 3D Printing: Enable support for 3D printing and 3D models in Drafting and Engineering workflows. The new feature is based on feedback we've received from customers and the features we added in AutoCAD® 2018. To support 3D printing, we've improved the way you can save your drawing as a 3D file. You can now draw the lines with a specified height, and then use the Save.3D File command to save the drawing with that height. You can also use the Export.3D Format command to output drawings to a 3D file format. For example, you can export 3D drawings to .stl files, and then open the file in MakerBot Desktop™ or the software that's on your device. The new 3D printing option allows you to use 3D models and
